• The same probability is assigned to each simple event in the sample space, • Suppose that $\Omega = \{\omega_1, \dots, \omega_N\}$ is a finite sample space. If all the outcomes are equally likely, then $P(\{\omega_i\}) = 1/N$ for every outcome ω_i . Then, for any event A , $P(A) = \frac{\# \text{ of elements in } A}{\# \text{ of elements in } \Omega}$

Elements of Probability Theory - [unclear]

Elements of Probability Theory The purpose of this chapter is to summarize some important concepts and results in probability theory. Of particular interest to us are the limit theorems which are powerful tools to analyze the convergence behaviors of econometric estimators and test statistics.

ELEMENTS OF PROBABILITY THEORY

Elements of Probability Theory † A collection of subsets of a set \mathcal{X} is called a σ -algebra if it contains \mathcal{X} and is closed under the operations of taking complements and countable unions of its elements. † A sub- σ -algebra is a collection of subsets of a σ -algebra which satisfies the axioms of a σ -algebra. † A measurable space is a pair $(\mathcal{X}; \mathcal{F})$ where \mathcal{X} is a set and \mathcal{F} is a

Probability is a mathematical technique for quantifying uncertainty. Statistics teaches us how to draw reliable conclusions when faced with uncertainty. Together, these elements form the foundation of modern scientific inquiry. We will spend the first half of the semester learning about probability rules and common probability distributions.
